Prologue: A Simple Machine

- Brief introduction
- Secure communication with a one-time pad
- Linear feedback shift registers
- Implications

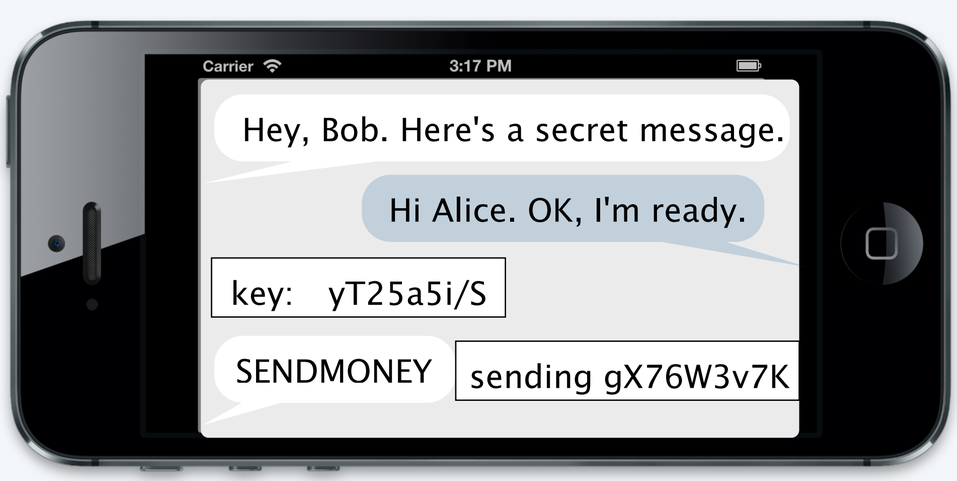
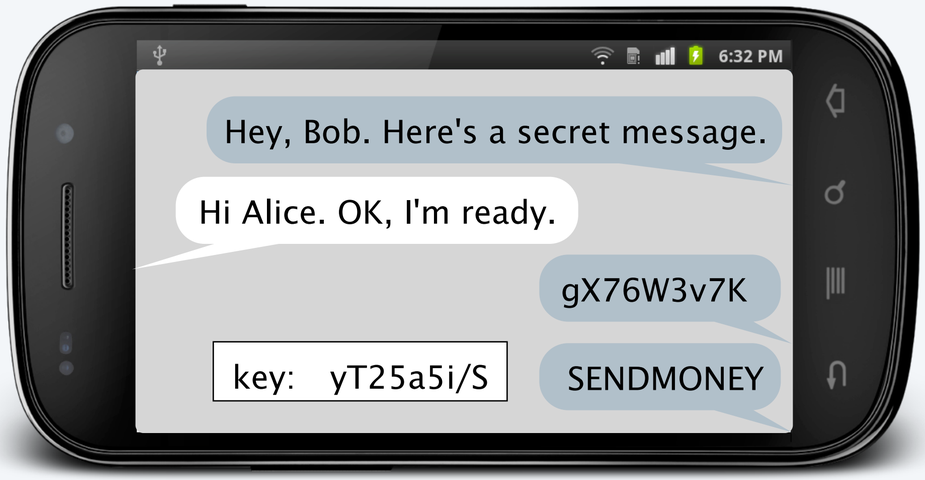
Sending a secret message with a cryptographic key

Alice wants to send a secret message to Bob.

- Sometime in the past, they exchange a cryptographic key.
- Alice uses the key to encrypt the message.
- Bob uses the *same* key to decrypt the message.

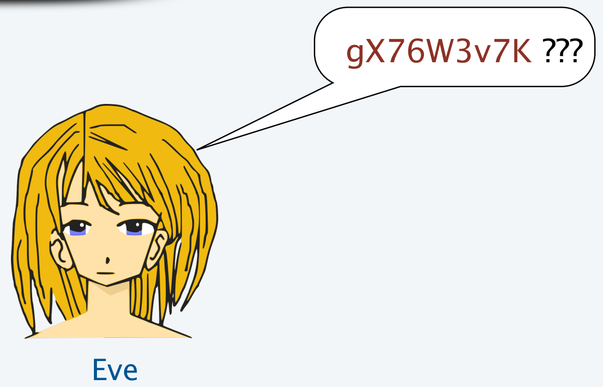




encrypted message gX76W3v7K is "in the clear" (anyone can read it)

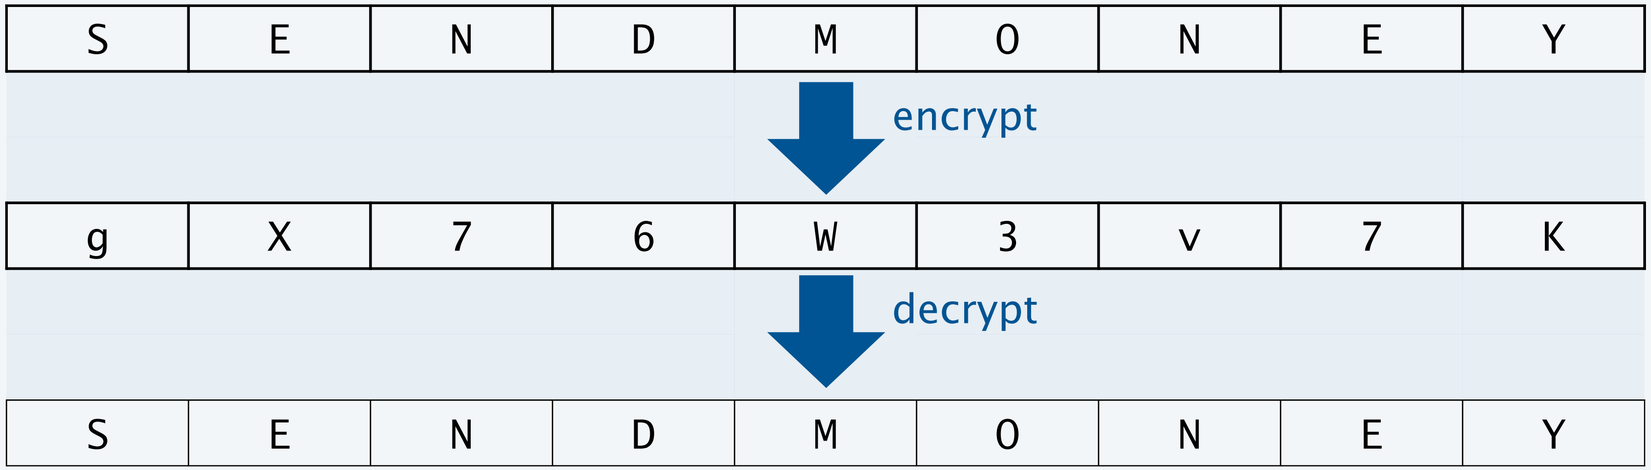
Critical point: Without the key, Eve cannot understand the message.

Q. How does the system work?



Encrypt/decrypt methods

Goal. Design a method to encrypt and decrypt data.



Example 1. Enigma encryption machine [German code, WWII]

- Broken by Turing bombe (one of the first uses of a computer).
- Broken code helped win Battle of Atlantic by providing U-boat locations.

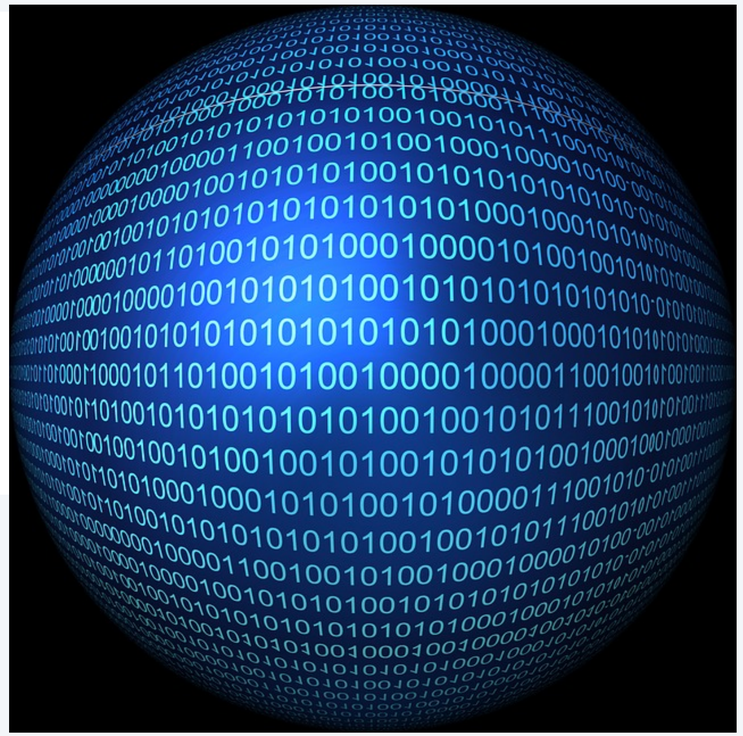
Example 2. One-time pad [details to follow]

Example 3. Linear feedback shift register [later this lecture]

A digital world

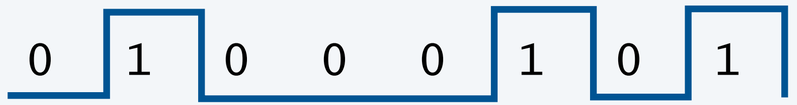
A *bit* is a basic unit of information.

- Two possible values (0 or 1).
- Easy to represent in the physical world (*on* or *off*).



In modern computing and communications systems, we represent *everything* as a sequence of bits.

- Text [details to follow in this lecture]
- Numbers
- Sound [details to follow in this course]
- Pictures [details to follow in this course]
- ...



$01000101_2 = 69_{10}$

Bottom line. If we can send and receive bits, we can send and receive *anything*.

well, not cars or cats (yet)

Encoding text as a sequence of bits

Base64 encoding of character strings

- A simple method for representing text.
- 64 different symbols allowed: `A-Z, a-z, 0-9, +, /.`
- 6 bits to represent each symbol.
- ASCII and Unicode methods used on your computer are similar.

	bits	symbols
Base64	6	64
ASCII	8	256
Unicode	16	65,536+

000000 A	001000 I	010000 Q	011000 Y	100000 g	101000 o	110000 w	111000 4

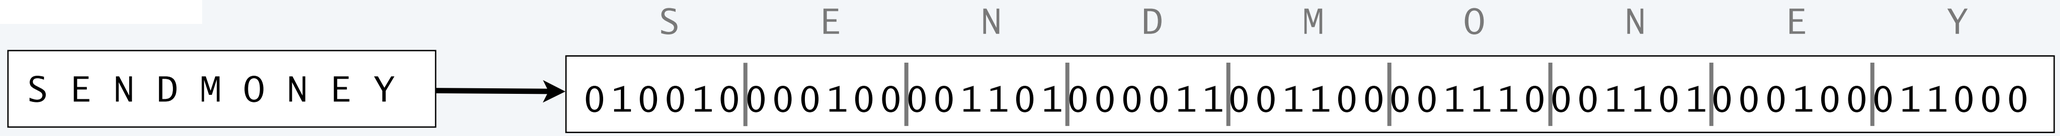
000111 H	001111 P	010111 X	011111 f	100111 n	101111 v	110111 3	111111 /

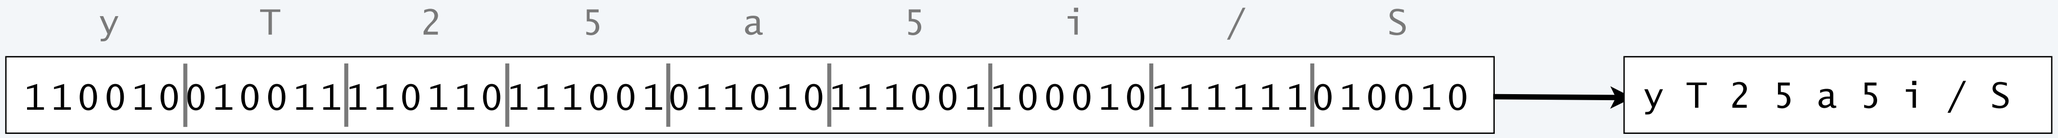
Example:



One-Time Pads

What is a one-time pad?

- A *cryptographic key* known only to the sender and receiver.
- Good choice: A *random* sequence of bits (stay tuned).
- Security depends on each sequence being used only once.



000000 A	001000 I	010000 Q	011000 Y	100000 g	101000 o	110000 w	111000 4
000001 B	001001 J	010001 R	011001 Z	100001 h	101001 p	110001 x	111001 5
000010 C	001010 K	010010 S	011010 a	100010 i	101010 q	110010 y	111010 6
000011 D	001011 L	010011 T	011011 b	100011 j	101011 r	110011 z	111011 7
000100 E	001100 M	010100 U	011100 c	100100 k	101100 s	110100 0	111100 8
000101 F	001101 N	010101 V	011101 d	100101 l	101101 t	110101 1	111101 9

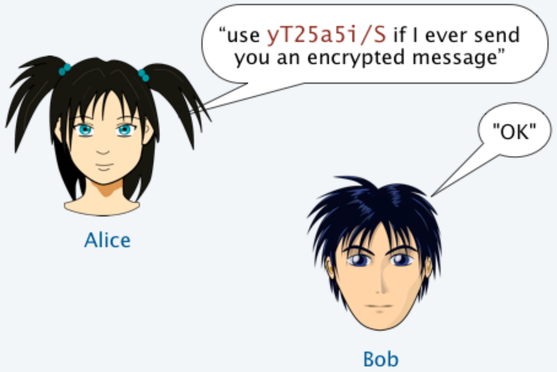
more convenient than bits for initial exchange

Note: Any sequence of bits can be decoded into a sequence of characters.

Encryption with a one-time pad

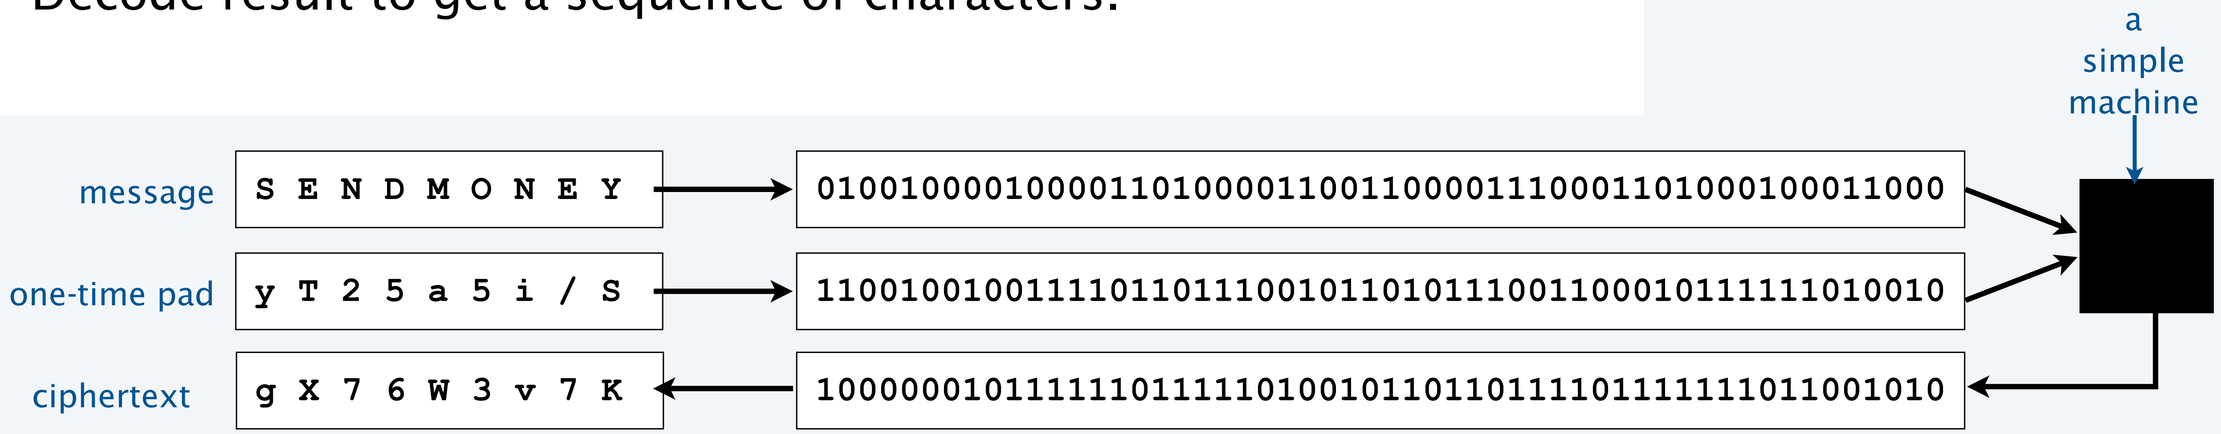
Preparation

- Create a "random" sequence of bits (a one-time pad).
- Send one-time pad to intended recipient through a secure channel.



Encryption

- Encode text as a sequence of *N* bits.
- Use the first *N* bits of the pad. ← important point: need to have as many bits in the pad as there are in the message.
- Compute a new sequence of *N* bits from the message and the pad.
- Decode result to get a sequence of characters.

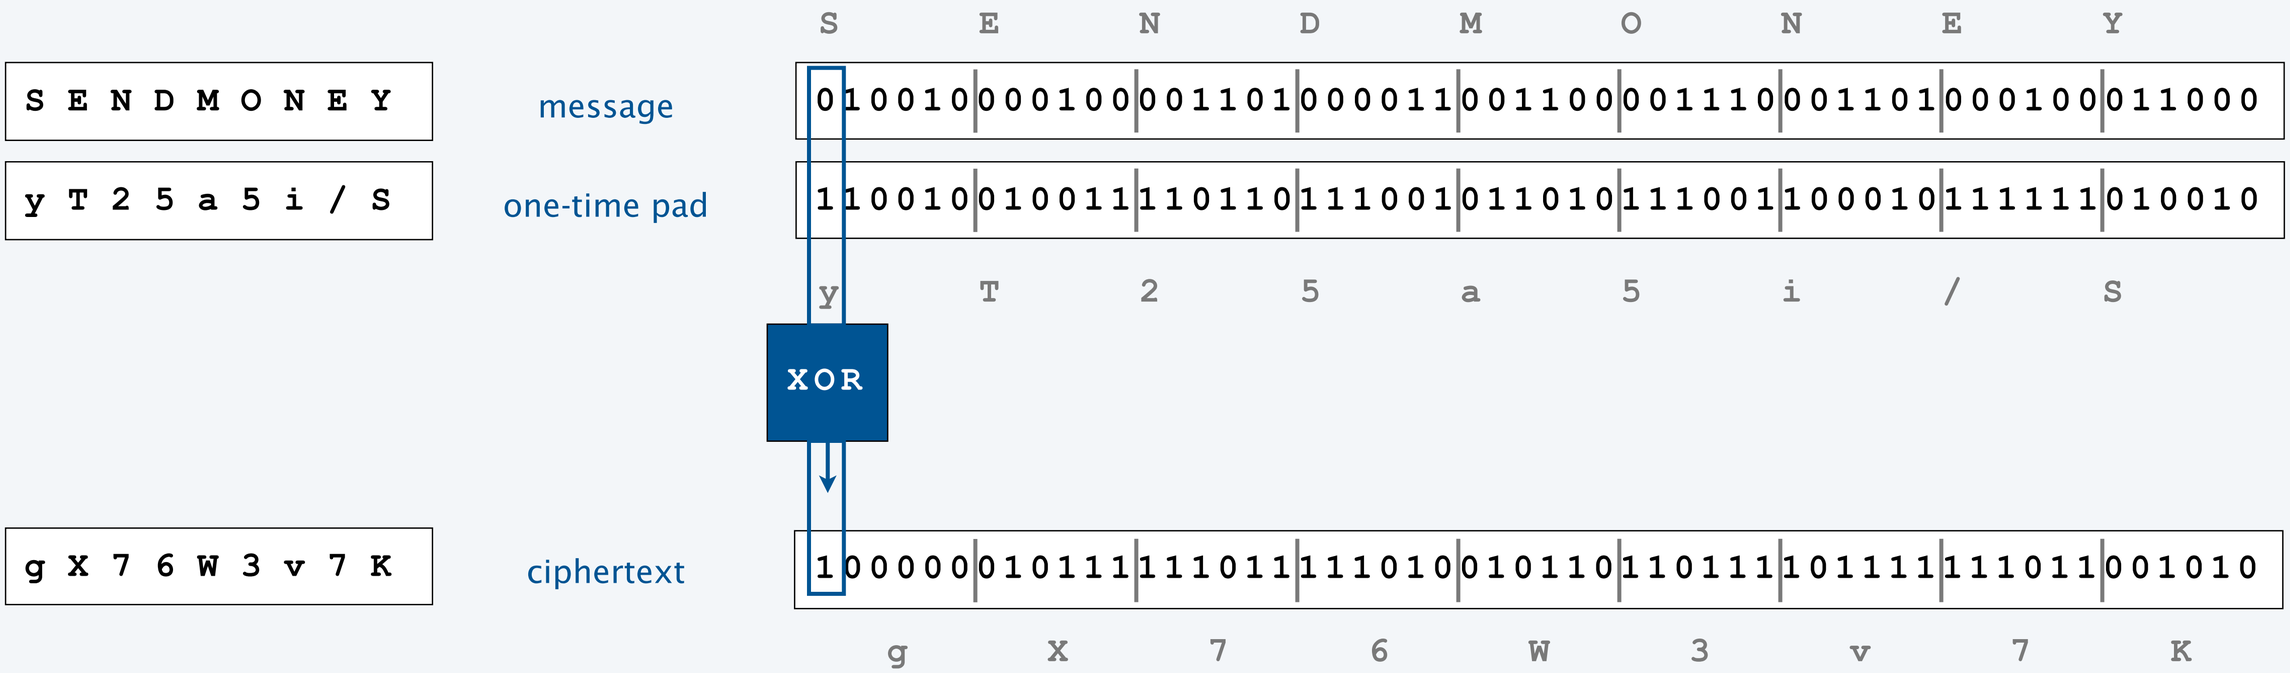


A (very) simple machine for encryption

To compute a ciphertext from a message and a one-time pad

- Encode message and pad in binary.
- Each ciphertext bit is the *bitwise exclusive or* of corresponding bits in message and pad.

Def. The bitwise exclusive or of two bits is 1 if they differ, 0 if they are the same.



Pop quiz on bitwise XOR encryption

Q. Encrypt the message `E A S Y` with the pad `0 1 2 3`.

Pop quiz on bitwise XOR encryption

Q. Encrypt the message E A S Y with the pad 0 1 2 3.

000000 A	001000 I	010000 Q	011000 Y	100000 g	101000 o	110000 w	111000 4
000001 B	001001 J	010001 R	011001 Z	100001 h	101001 p	110001 x	111001 5
000010 C	001010 K	010010 S	011010 a	100010 i	101010 q	110010 y	111010 6

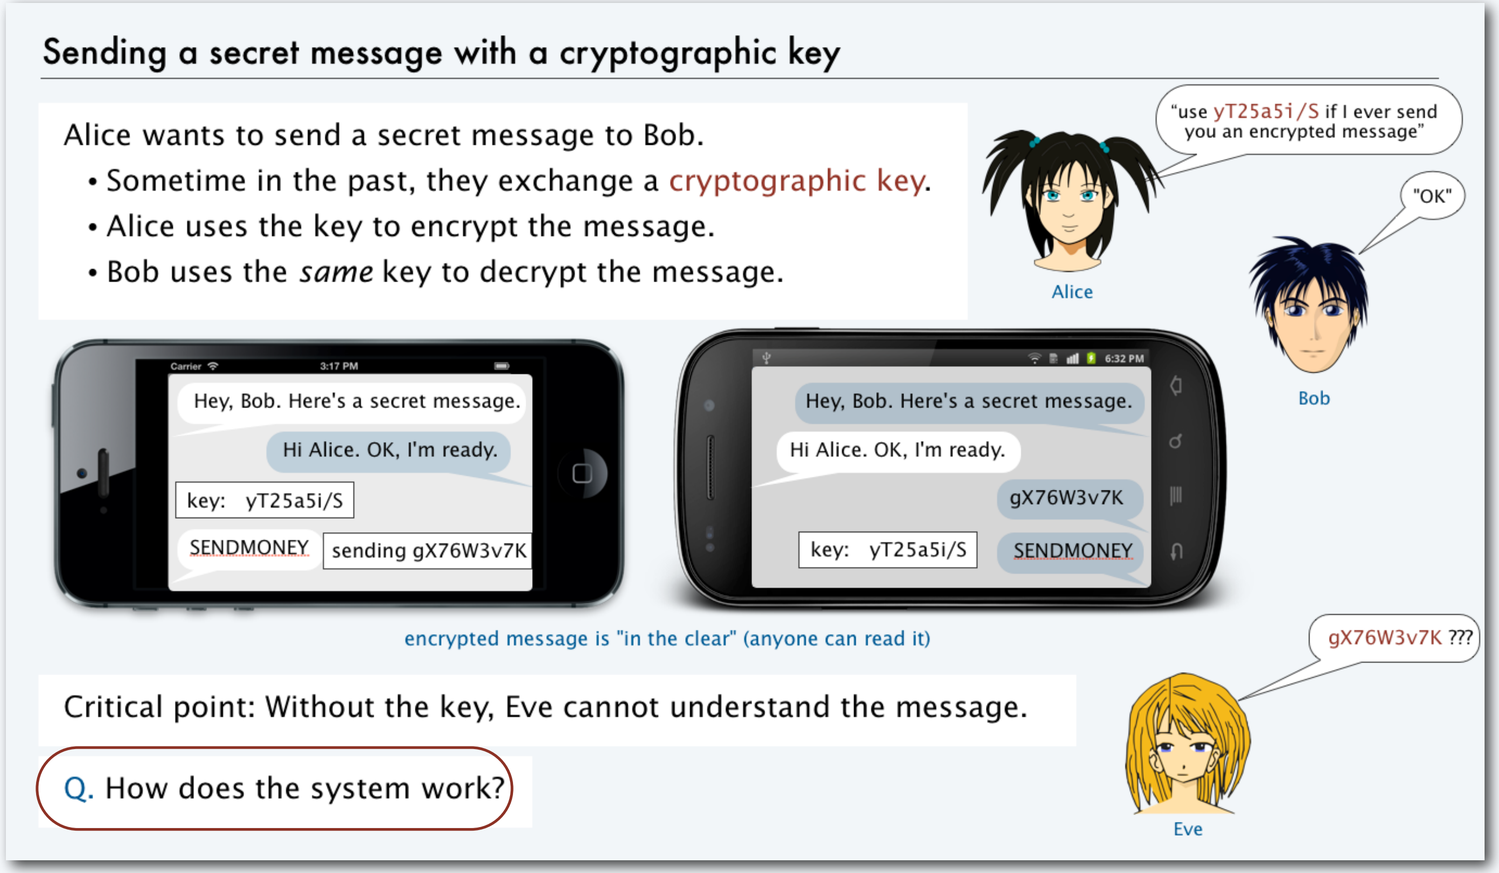
Decryption with a one-time pad



A. Alice's device uses a "bitwise exclusive or" machine to encrypt the message.

Q. What kind of machine does Bob's device use to *decrypt* the message?

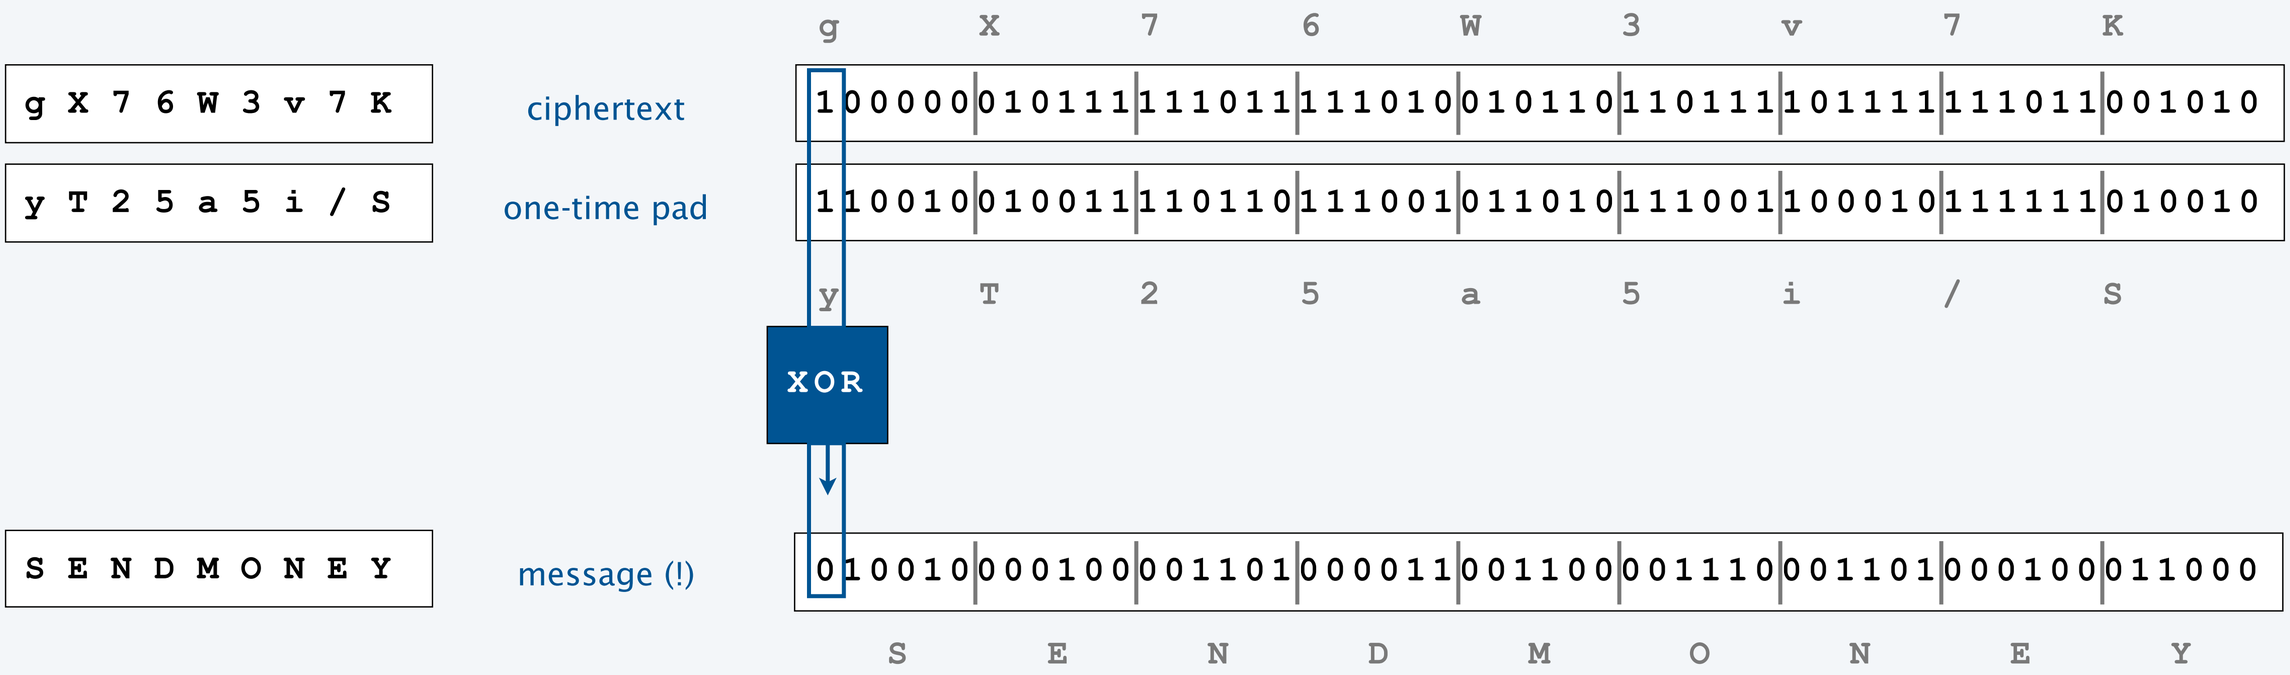
A. The same one (!!)

A (very) simple machine for encryption and decryption

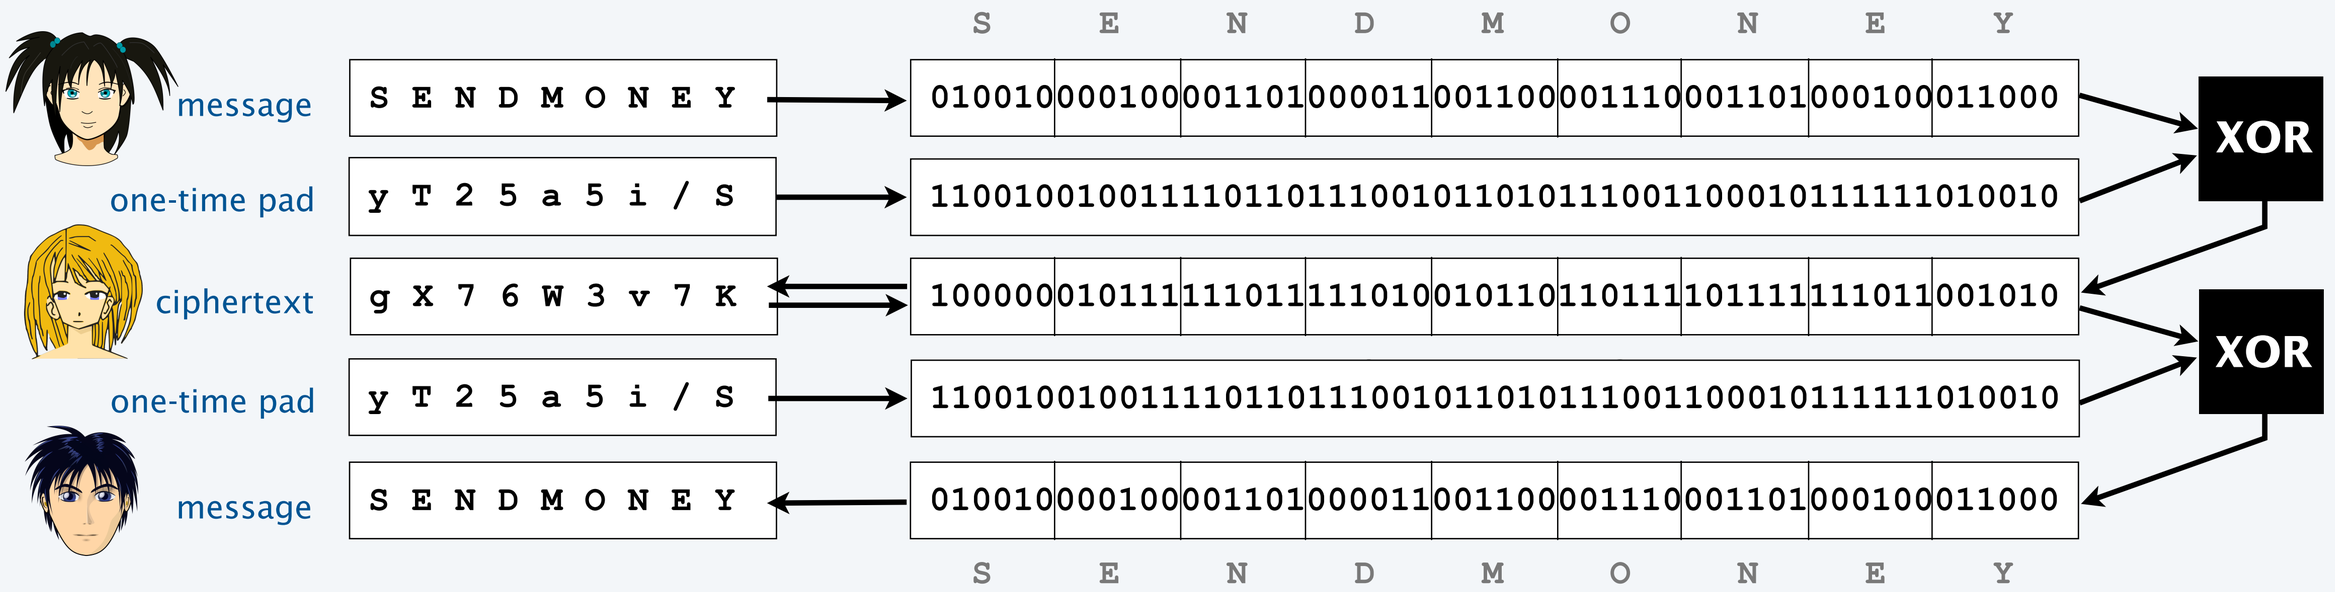
To compute a *message* from a *ciphertext* and a one-time pad

- Use binary encoding of ciphertext and pad.
- Each message bit is the *bitwise exclusive or* of corresponding bits in ciphertext and pad.

1 if they differ; 0 if they are the same



Why does it work?



Crucial property: Decrypted message is the same as the original message.

Let m be a bit of the message and k be the corresponding bit of the one-time pad.

To prove: $(m \wedge k) \wedge k = m$ ← Notation: $m \wedge k$ is equivalent to XOR(m, k)

Approach 1: Truth tables

m	k	$m \wedge k$	$(m \wedge k) \wedge k$
0	0	0	0
0	1	1	0
1	0	1	1
1	1	0	1

✓

Approach 2: Boolean algebra

$$(k \wedge k) = 0$$
$$m \wedge 0 = m$$
$$(m \wedge k) \wedge k = m \wedge (k \wedge k)$$
$$= m \wedge 0$$
$$= m$$

✓

Will other arithmetical operation support encryption/decryption?

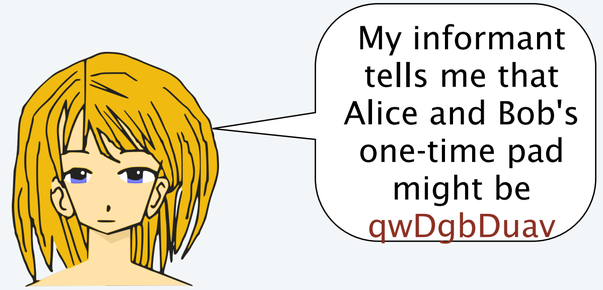
*

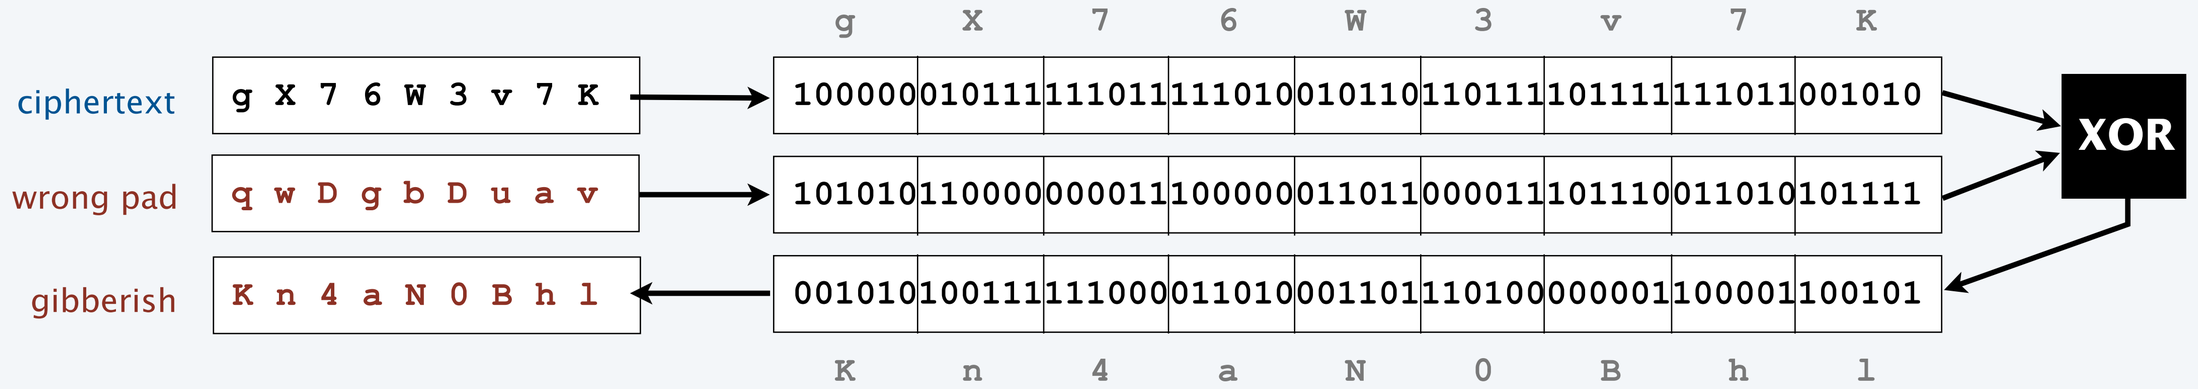
/

+

Decryption with the wrong pad

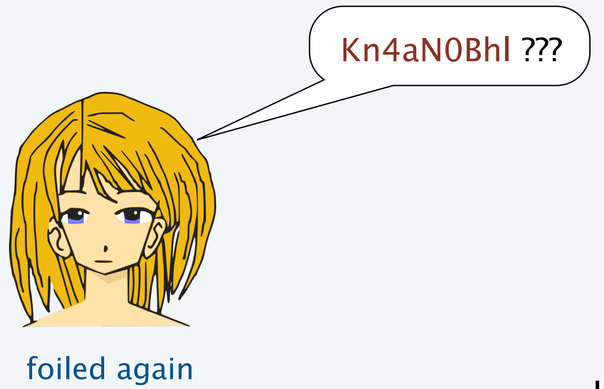
Eve *cannot* read a message without knowing the pad.





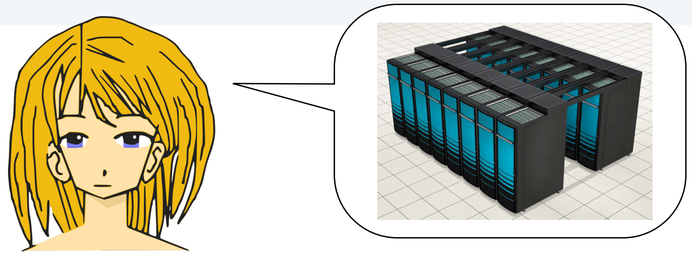
One-time pad is provably secure [Shannon, 1940s]

- IF each pad is used only once,
- AND the pad bits are random,
- THEN Eve cannot distinguish ciphertext from random bits.



Eve's problem with one-time pads

Eve has a computer. Why not try all possibilities?



Eve

Problem

- 54 bits, so there are 2^{54} possible pad values.
- Suppose Eve could check a million values per second.
- It would still take 570+ years to check all possibilities.

Much worse problem

- There are also 2^{54} possible messages.
- If Eve were to check all the pads, she'd see all the *messages*.
- No way to distinguish the real one from any other.

One-time pad is provably secure.

pad value	*message?*

Goods and bads of one-time pads

Goods.

- Very simple encryption method.
- Decrypt with the same method.
- Provably unbreakable if bits are truly random.
- Widely used in practice.

```

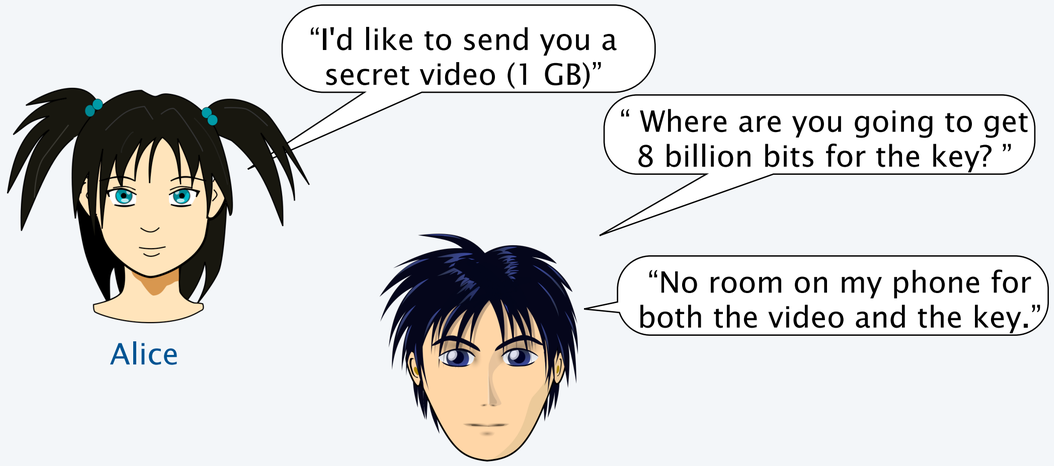
```

a one-time pad

cold war hotline

Bads.

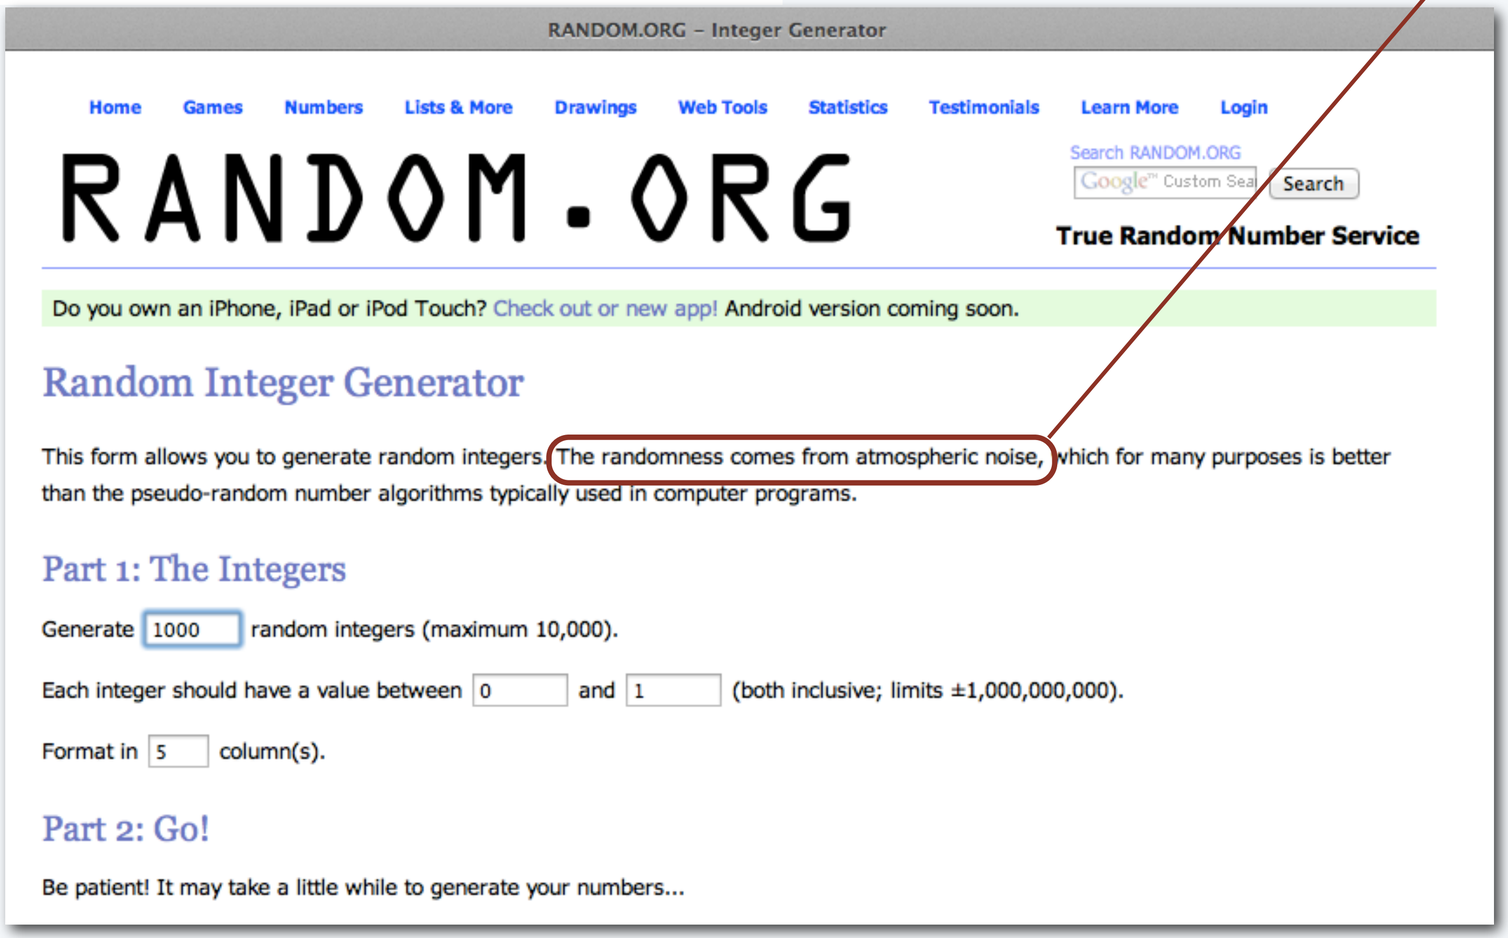
- Easily breakable if seed is re-used.
- Truly random bits are very hard to come by.
- Need separate secure channel to distribute key.
- Pad must be as long as the message.



Random bits are not so easy to find

You might look on the internet.

The randomness comes from atmospheric noise



... if you trust the internet.

Next: Creating a (long) sequence of "pseudo-random" bits from a (short) key.

Prologue: A Simple Machine

- Brief introduction
- Secure communication with a one-time pad
- Linear feedback shift registers
- Implications

A pseudo-random number generator

is a *deterministic* machine that produces a long sequence of *pseudo random* bits.

Examples

Enigma.

Linear feedback shift register (next).

Blum-Blum-Shub generator.

...

[an early application of computing]

[research still ongoing]

" Anyone who considers arithmetical methods of producing random digits is, of course, in a state of sin. "

– John von Neumann

A pseudo-random number generator

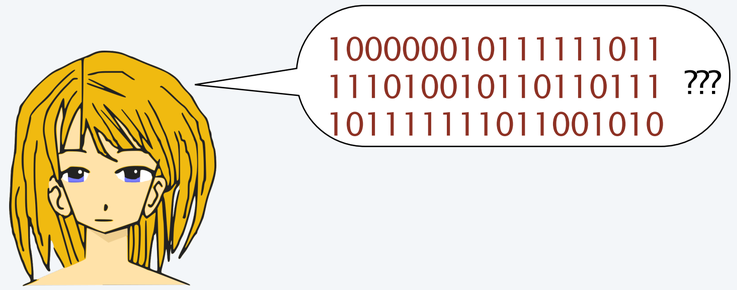
is a *deterministic* machine that produces a long sequence of *pseudo random* bits.

Deterministic: Given the current state of the machine, we know the next bit.

An absolute requirement: Alice and Bob need the same sequence.

Random: We never know the next bit.

Pseudo-random: The sequence of bits *appears to be* random.



Appears to be random??

- A profound and elusive concept.
- For this lecture: "Has enough properties of a random sequence that Eve can't tell the difference".

Ex. 1: No long repeats
Ex. 2: About the same number of 0s and 1s
Ex. 3: About the same number of 00s, 01s, 10s, and 11s.
...

Which of these sequences appear to be random?

0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	✗

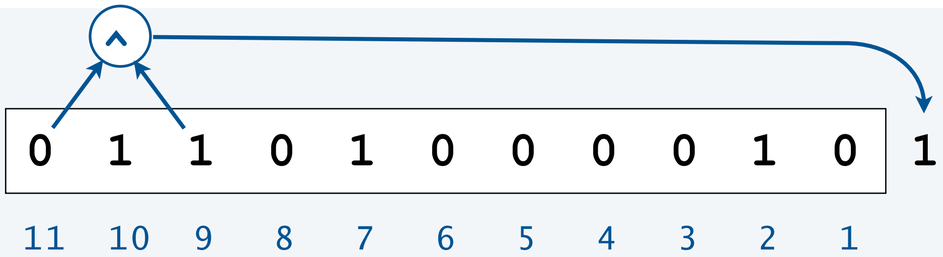
Note: Any one of them *could be* random!

Linear feedback shift register

Terminology

- Bit: 0 or 1.
- Cell: storage element that holds one bit.
- Register: sequence of cells.
- Seed: initial sequence of bits.
- Feedback: Compute XOR of two bits and put result at right.
- Shift register: when clock ticks, bits propagate one position to left.

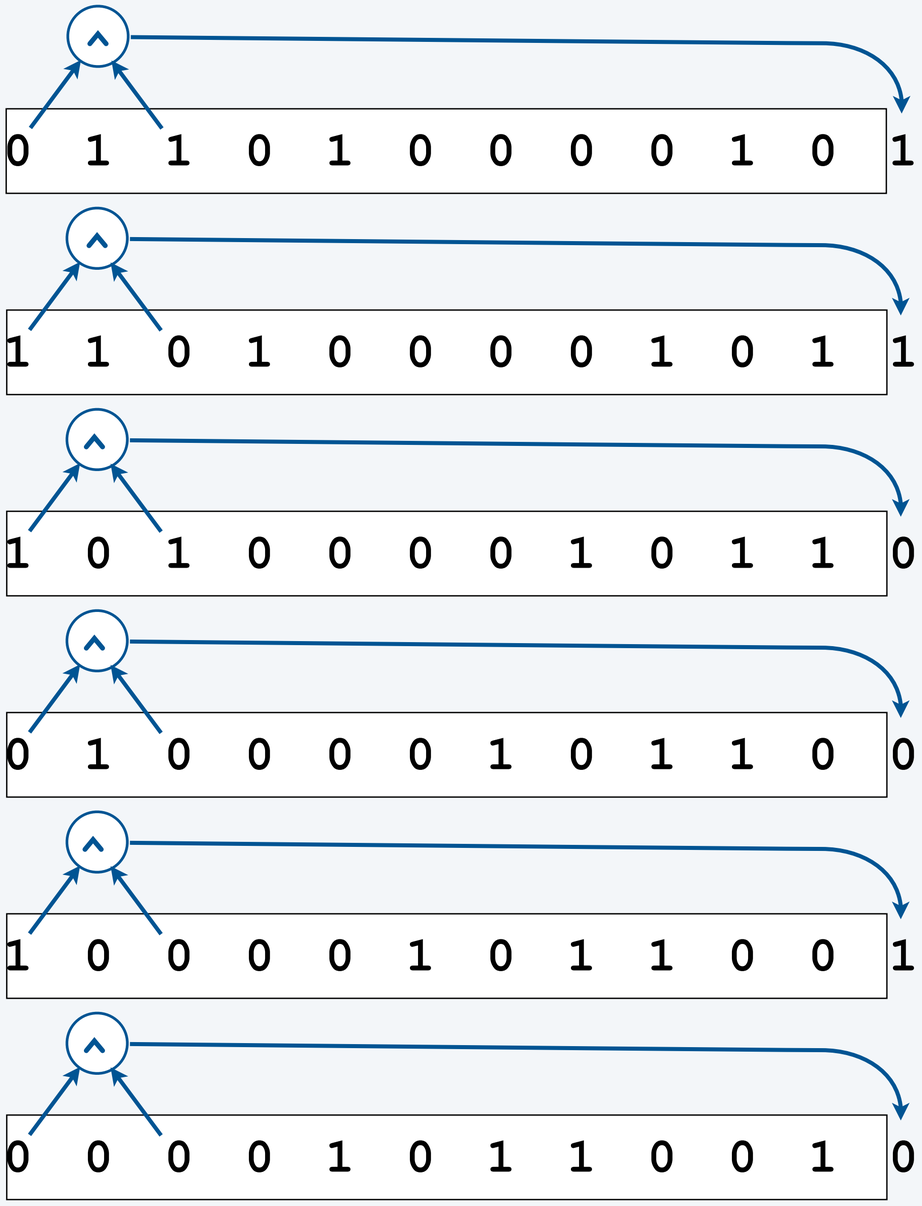
An [11, 9] LFSR



More terminology

- Tap: Bit positions used for XOR (one must be leftmost). ← Numbered from right, starting at 1.
- [*N*, *k*] LFSR: *N*-bit register with taps at *N* and *k*. ← Not all values of k give desired effect (stay tuned).

Linear feedback shift register simulation



History of register contents	Time
0 1 1 0 1 0 0 0 0 1 0	0
1 1 0 1 0 0 0 0 1 0 1	1

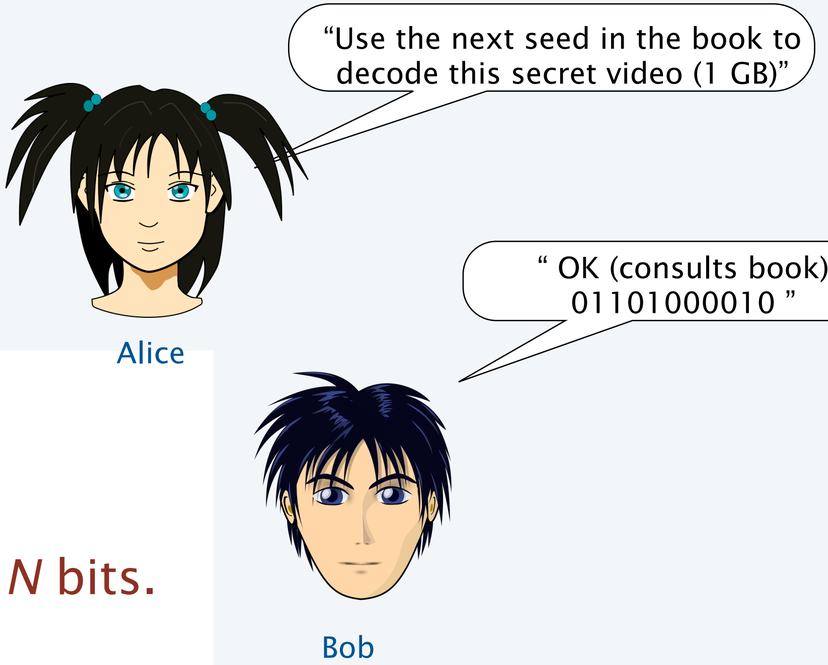
Encryption/decryption with an LFSR

Preparation

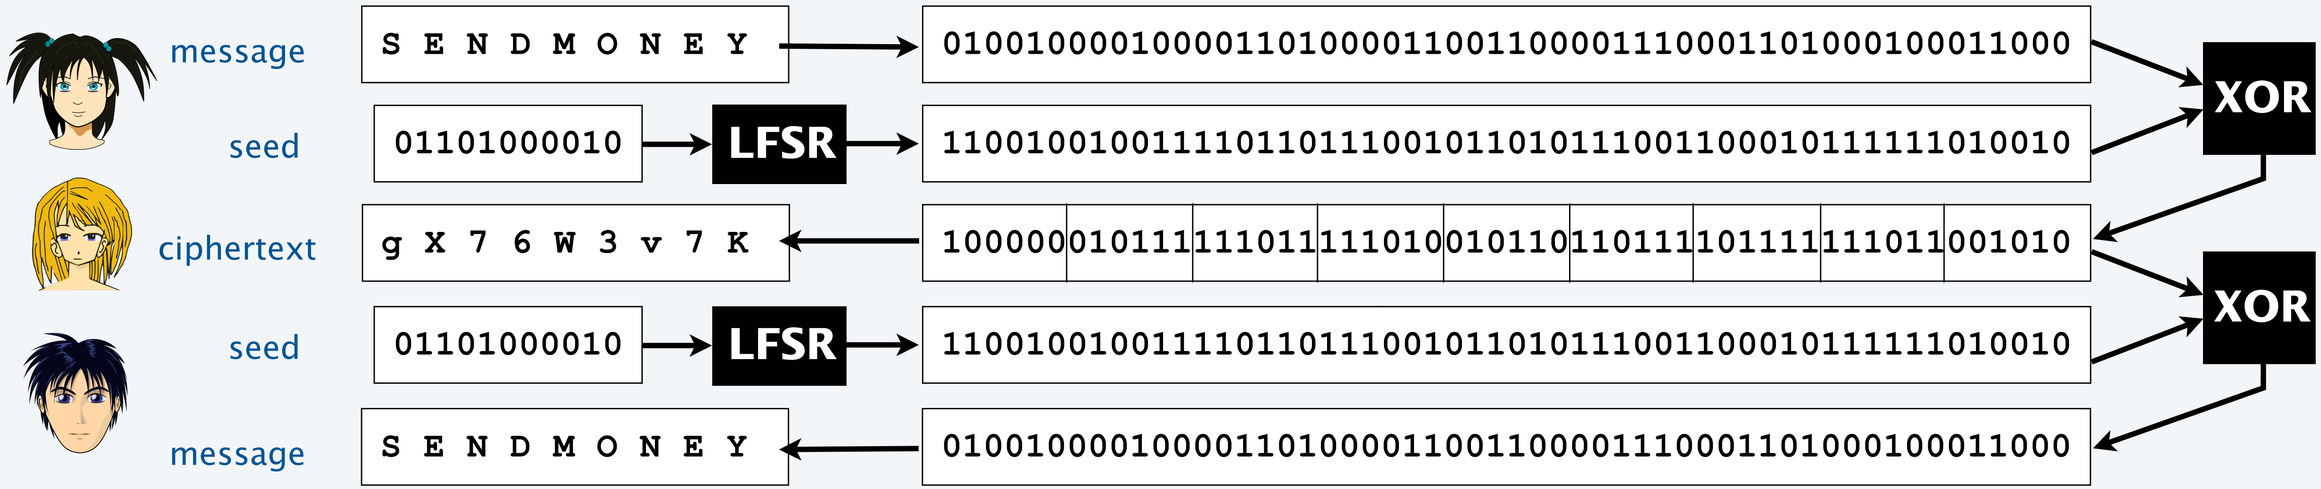
- Alice creates a book of "random" (short) seeds.
- Alice sends the book to Bob through a secure channel.



Encryption/decryption

- Alice sends Bob a description of which seed to use.
- They use the specified seed to initialize an LFSR and produce *N* bits.

  [and proceed in the same way as for one-time pads]

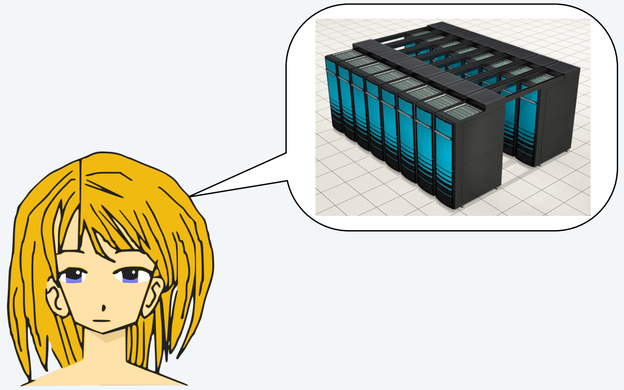


Eve's opportunity with LFSR encryption

Without the seed, Eve cannot read the message.

Eve has computers. Why not try all possible seeds?

- Seeds are short, messages are long.
- All seeds give a tiny fraction of all messages.
- Extremely likely that all but real seed will produce gibberish.



Eve

Good news (for Eve): This approach can work.

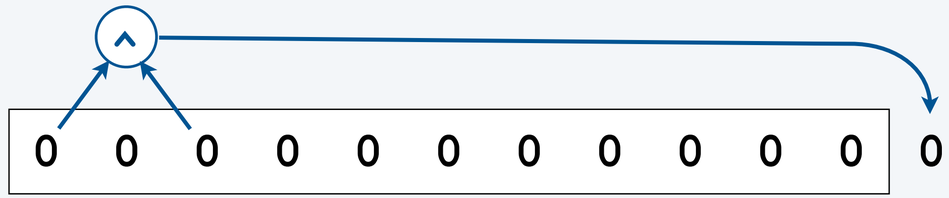
- Ex: 11-bit register implies 2047 possibilities.
- Extremely likely that only *one* of those is not gibberish.
- After this course, *you* could write a program to check whether any of the 2047 messages have words in the dictionary.

Bad news (for Eve): It is easy for Alice and Bob to use a much longer LFSR.

Key properties of LFSRs

Property 1.

- Don’t use all 0s as a seed!
- Fill of all 0s will not otherwise occur.



Key properties of LFSRs

Property 1.

- Don't use all 0s as a seed!
- Fill of all 0s will not otherwise occur.

Property 2. Bitstream must eventually cycle.

- $2^N - 1$ nonzero fills in an N-bit register.
- Future output completely determined by current fill.

Ex. [4,3] LFSR

0 0 1 0 0	0
0 1 0 0 1	1
1 0 0 1 1	2
0 0 1 1 0	3
0 1 1 0 1	4
1 1 0 1 0	5
1 0 1 0 1	6
0 1 0 1 1	7
1 0 1 1 1	8
0 1 1 1 1	9
1 1 1 1 0	10
1 1 1 0 0	11
1 1 0 0 0	12
1 0 0 0 1	13
0 0 0 1 0	14
0 0 1 0	15

Key properties of LFSRs

Property 1.

- Don't use all 0s as a seed!
- Fill of all 0s will not otherwise occur.

Property 2. Bitstream must eventually cycle.

- $2^N - 1$ nonzero fills in an N-bit register.
- Future output completely determined by current fill.

Property 3. Cycle length in an N-bit register is *at most* $2^N - 1$.

- Could be smaller; cycle length depends on tap positions.
- Need theory of finite groups to know good tap positions.

Ex. [4,2] LFSR

0	0	1	0	1	0
0	1	0	1	1	1
1	0	1	1	1	2
0	1	1	1	1	3
1	1	1	1	0	4
1	1	1	0	0	5
1	1	0	0	0	6
1	0	0	0	1	7
0	0	0	1	0	8
0	0	1	0		

Key properties of LFSRs

Property 1.

- Don't use all 0s as a seed!
- Fill of all 0s will not otherwise occur.

Property 2. Bitstream must eventually cycle.

- $2^N - 1$ nonzero fills in an N-bit register.
- Future output completely determined by current fill.

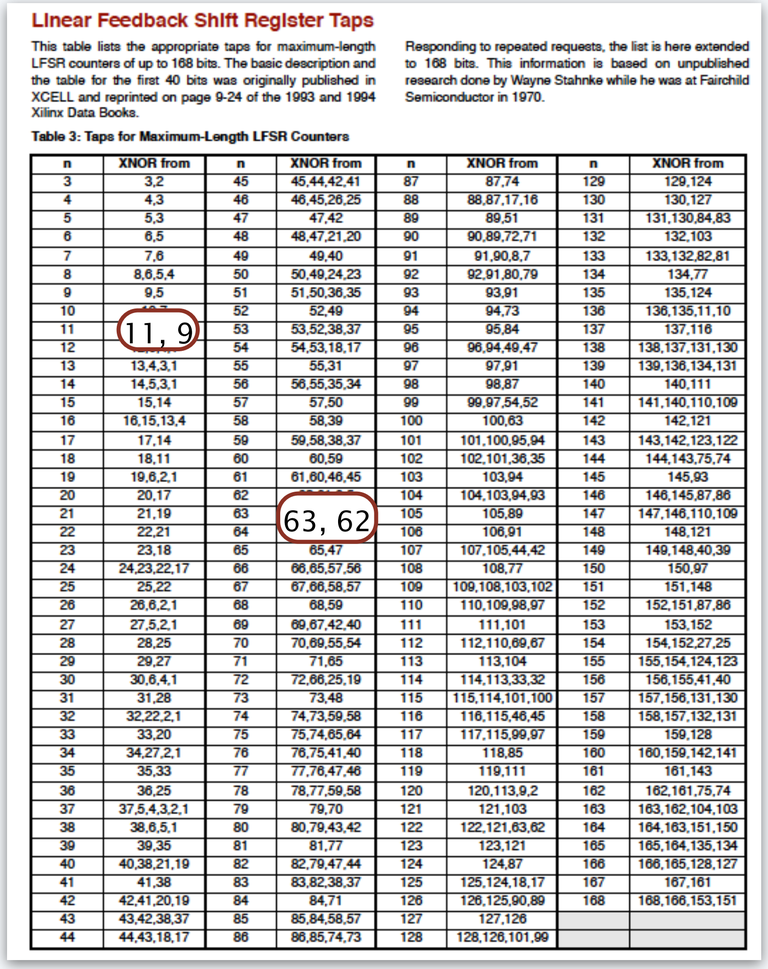
Property 3. Cycle length in an N-bit register is at most $2^N - 1$.

- Could be smaller; cycle length depends on tap positions.
- Need theory of finite groups to know good tap positions.

Bottom line.

- [11, 9] register generates 2047 bits before repeating.
- [63, 62] register generates 2^{63} -1 bits before repeating.

← Definitely preferable: small cost, huge payoff.



Linear Feedback Shift Register Taps

This table lists the appropriate taps for maximum-length LFSR counters of up to 168 bits. The basic description and the table for the first 40 bits was originally published in XCELL and reprinted on page 9-24 of the 1993 and 1994 Xilinx Data Books.

Responding to repeated requests, the list is here extended to 168 bits. This information is based on unpublished research done by Wayne Stahnke while he was at Fairchild Semiconductor in 1970.

Table 3: Taps for Maximum-Length LFSR Counters

n	XNOR from	n	XNOR from	n	XNOR from	n	XNOR from
3	3,2	45	45,44,42,41	87	87,74	129	129,124
4	4,3	46	46,45,26,25	88	88,87,17,16	130	130,127
5	5,3	47	47,42	89	89,51	131	131,130,84,83
6	6,5	48	48,47,21,20	90	90,89,72,71	132	132,103

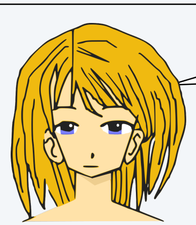
XILINX manual, 1990s

Eve's problem with LFSR encryption

Without the seed, Eve cannot read the message.



Eve

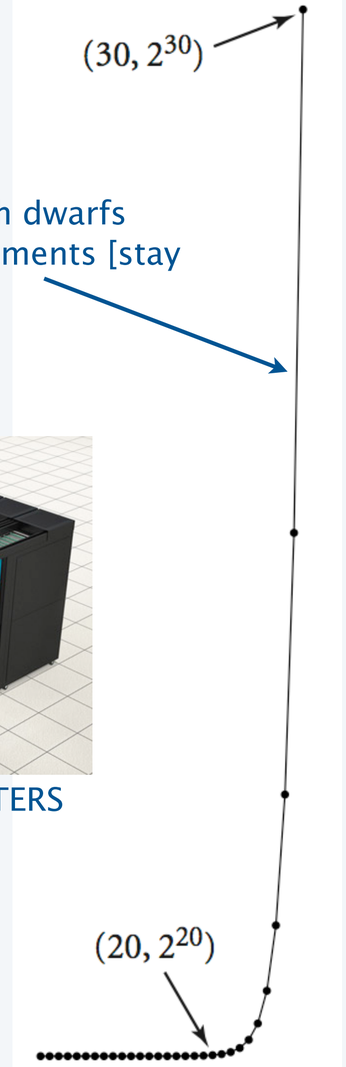
Eve has computers. Why not try all possible seeds?

- Seeds are short, messages are long.
- All seeds give a tiny fraction of all messages.

Bad news (for Eve): There are still way too many possibilities.

- Ex: 63-bit register implies $2^{63} - 1$ possibilities.
- If Eve could check 1 million seeds per second, it would take her 2923 centuries to try them all!

NOT ENOUGH COMPUTERS



Bad news (for Alice and Bob): LFSR output is *not* random.

experts have cracked LFSRs

Goods and bads of LFSRs

Goods.

- Very simple encryption method.
- Decrypt with the same method.
- Scalable: 20 cells for 1 million bits; 30 cells for 1 billion bits.
- Widely used in practice. [Example: military cryptosystems.]

a commercially available LFSR

Bads.

- Easily breakable if seed is re-used.
- Still need secure key distribution.
- Experts can crack LFSR encryption.

Example.

- CSS encryption widely used for DVDs.
- Widely available DeCSS breaks it!

```
/*      efdtt.c      Author:  Charles M. Hannum <root@ihack.net>              */
/*      Usage is:  cat title-key scrambled.vob | efdtt >clear.vob             */

#define m(i)(x[i]^s[i+84])<<

                      unsigned char x[5]       ,y,s[2048];main(
                      n){for( read(0,x,5      );read(0,s  ,n=2048
                                ); write(1    ,s,n)          )if(s
                     [y=s       [13]%8+20]   /16%4   ==1       ){int
                     i=m(       1)17   ^256 +m(0)    8,k       =m(2)
                     0,j=       m(4)    17^ m(3)    9^k*      2-k%8
                     ^8,a      =0,c     =26;for    (s[y]     -=16;
                    --c;j   *=2)a=      a*2^i&     1,i=i /2^j&1
                    <<24;for(j=          127;      ++j<n;c=c>
                                         y)
                                         c

                              +=y=i^i/8^i>>4^i>>12,
                      i=i>>8^y<<17,a^=a>>14,y=a^a*8^a<<6,a=a

                                 ;}}
```

DeCSS DVD decryption code

In the context of this lecture…

Very simple computation procedure

- Can do an important and interesting job
- Can be extremely complicated to understand

Once the understanding is developed

- Build a more complicated machine
- Try to understand it

Image sources

http://pixabay.com/en/ball-http-www-crash-administrator-216837/

http://commons.wikimedia.org/wiki/File:Einstein-formal_portrait-35.jpg

Prologue: A Simple Machine

- Brief introduction
- Secure communication with a one-time pad
- Linear feedback shift registers
- Implications

LFSRs and general-purpose computers

LFSR

computer

component	*LFSR*	*computer*
control	start, stop, load	same
clock		same
memory	12 bits	billions of bits
input	12 bits	bit sequence
computation	shift, XOR	+ – * / ...
output	pseudo-random bit sequence	any computable bit sequence

Important similarities.

- Both are built from simple components.
- Both scale to handle huge problems.
- Both require careful study to use effectively.

Critical differences: Operations, input. ← but the simplest computers differ only slightly from LFSRs!

- General purpose computer can simulate *any* abstract machine.
- All general purpose computers have equivalent power (!) [stay tuned].

A Profound Idea

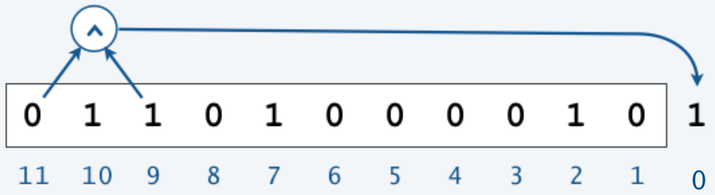
Programming. We can write a Java program to simulate the operation of any abstract machine.

- Basis for theoretical understanding of computation.
- Basis for bootstrapping real machines into existence.

Stay tuned (we cover these sorts of issues in this course).

YOU will be writing code like this within a few weeks.

```
public class LFSR
{
    public static void main(String[] args)
    {
        int[] a = { 0, 0, 1, 0, 0, 0, 0, 1, 0, 1, 1, 0 };
        for (int t = 0; t < 2000; t++)
        {
           a[0] = (a[11] ^ a[9]);
           System.out.print(a[0]);
           for (int i = 11; i > 0; i--)
                a[i] = a[i-1];
        }
        System.out.println();
    }
}
```



```
% java LFSR
110010010011110110111001011010111001100010
011111101001000010011010010111100110010010
111111011100000101011000100001110101001100
100001111001001100111011111110101000001000
001000101001010100011000001011110001001000
110101101111000110100110111001111101...
```

Profound questions

Q. What is a random number?

LFSRs *do not* produce random numbers.

- They are *deterministic*. ← von Neumann's "state of sin": we *know* that "deterministic" is incompatible with "random"
- It is not obvious how to distinguish the bits LFSRs produce from random,
- BUT experts have figured out how to do so.

Q. Are random processes found in nature?

- Motion of cosmic rays or subatomic particles?
- Mutations in DNA?

Q. Is the natural world a (not-so-simple) deterministic machine??

" God does not play dice. "

– Albert Einstein
